Acute and chronic intoxication by atebriin. V.G. Uzunov
and S. Bozhinov. *Avtzvare Acad. Med. "Volyo Tcher-*
tenec" 30, 397-400 (1950-51); cf. Fitzhugh, et al., C.A. 40,
15:90. — In rabbits, intravenous injection of lethal doses of
atebriin (I) did not modify the permeability of the blood-
cerebral barrier to trypan blue or NaI, and did not produce
any pathophysiological effects. The barrier was not affected during
chronic intoxication with 5 mg. I per kg. wt. for a
period of 80 days, but there was a lipidic infiltration of the
vascular endothelium in the central nervous system and the
liver showed hydropic degeneration. When I was intro-
duced suboccipitally the min. lethal dose was 5 mg./kg. wt.
After the introduction of I an initial period of light reflex
excitation was followed by paralysis of the circulatory and
respiratory systems, independent of the amt. of I used.

Title : Peculiarities of Epileptoid Attacks Induced by Intravenous, Intracarotid and Suboccipital Introduction of Pyramidon, Cardiazol and Camphor Oil.

Orig Pub : Izv. Otd. biol. i med. n. B"lg. AN Ser. eksperim. biol. i med., 1957, No 3, 25-30.

Abstract : Cardiazol, introduced intravenously or into the carotid artery of the rabbit, induces an attack with chaotic motor excitement, which changes to tonic and later to clonic convulsions. Camphor oil, as well as pyramidon, under these conditions, induces repeated clonico-tonic convulsions.

Card 1/2

v-4

Abs Jour : Ref Zhur - Biol., No 21, 1958, 98477

The picture of the attack does not depend on the concentration but on the total amount of the preparation. Suboccipital introduction of pyramidon leads, depending on the concentration (5% or 10% solutions), to complex coordinated purposeful movements (for example, scratching of the place of injection), which change to convulsions in the region of facial and neck musculature and later of the whole body. Between convulsive attacks, a high reflex excitability is noted. Cardiazole, under these conditions, induces a more diverse picture of attacks. The peculiarity of the camphor oil effect by suboccipital introduction is a deep sleep at dosages of 0.2 - 0.4 ml/kg of a 20% solution without convulsive attacks and a very severe attack with quick death at dosages > 0.6 ml/kg.

Title : The Influence of Largaktil (Aminazine) on the Nature and the Course of an Epileptoid Attack, induced by Cardiasol, Pyramidon, Atabrine, and Picrotoxin.

Orig Pub : Izv. otd. biol., i med. nauki. Bulg. AN Ser. experim. biol. i med. 1957, No 1, 5-14

Abstract : In experiments on rabbits largaktil changed in a variety of ways the intensity and character of epileptoid attacks, induced by cardiasol, pyramidon, and atabrine, while it exerted no substantial influence on the attack, induced by picrotoxin. The authors explained this by the variety in the pathogenesis of the attacks. Since the anticonvulsive action of largaktil manifests itself chiefly in the phylogenetic inhibitions of the very youngest divisions of the central nervous system, the lack of largaktil effect on the picrotoxin induced attack is explained hypothetically by the wide range and the peculiar intensity of picrotoxin action on the central nervous system.

Title : Experimental Studies of the Pathogenesis of Epileptoid
Fits.

Orig Pub : Zh. nevropatol. i psichiatrii, 1957, 57, No 6, 731-739

Abstract : The course of epileptoid fits (EF) was studied in rabbits
following injection of camphor, cardiazol, pyramidon,
pycrotoksin, and atebriin into various sectors of the vascular
duct, as well as following their suboccipital adminis-
tration. Specific symptoms of EF are described which are
dependent upon the characteristics of spasmodic agents and
their application method. A preliminary intravenous injec-
tion of novocain or largactil resulted in diminution of
spasmodic phenomena. -- S.A. Dolina.

"On the Clinical Picture of Childhood Acute Alcohol Encephalopathy with a Prolonged Course."

Sofia, Nevrologiya, Psichiatriya i Nevrokhirurgiya, Vol 5, No 2, 1966, pp 83-94

Abstract [authors' Russian and English summaries, modified]: On the basis of 8 cases observed in Bulgaria (one case described in detail), three successive stages of the clinical picture of childhood acute alcohol encephalopathy are discussed: the acute stage of prolonged alcohol coma; the transitory stage following recovery from coma; and the end stage of epilepsy and mental deterioration. The coma develops dramatically with initial convulsions (decerebration state) and autonomic phenomena, or with initial epileptic seizures. In 3 cases the decerebration rigidity was permanent and grave. Two of these cases ended in death and showed bilateral symmetrical necrosis of the putamen. In four cases the decerebration phenomena occurred as attacks. Only in one case (the youngest patient (1 year and 7 months old) the decerebration rigidity was not manifest and replaced by an athetous- and torsiodystonic syndrome combined with pyramidal symptoms. In this stage hyperthermia, tachycardia, arterial hypotension and leucocytosis were observed as signs of disturbance.

BULGARIA

Sofia, Nevrologiya, Psichiatriya i Nevrokhirurgiya, Vol 5, No 2, 1966, pp
83-94

neurological and psychotic phenomena appeared: ataxia, hyperkyneses (myoclonia, "bows," ballism), mild spastic and flaccid pareses, visual agnosia, delirious states and certain decomposition of speech. In the final state, severe and permanent disturbances of the bioelectrical activity were observed, involving the reticular formation and clinically manifest as epilepsy, almost inaccessible to treatment. Often a more or less manifest deterioration of the child's personality was found, with symptoms of euphoria and puerilism, intellectual retardation and, in some cases, irreversible dementia. TITLE: Experimental investigation of the stability of cylindrical shells above the elastic limit

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 142, no. 2, 1962, 299-301

TEXT: The stability of closed circular cylindrical shells within and above the limit of elasticity of D16T (D16T) duralumin was studied in 30 specimens subjected to axial compression. The length L was double the radius R of the wall center. R/h , where h is the wall strength, varied between 25 and 135. The specimens were divided into three groups. In the first one, R/h ranged between 80 and 130. The stability of the relevant specimens, which buckle within the limits of elasticity, is lost abruptly and rhombic indentations are formed. R/h of the second group ranged between 35 and 80. In this group, the compressive stress at the moment of buckling was above the elastic limit of the material. The stability of the shells is destroyed by the abrupt formation of indentations. The third group consists of shells with R/h between 25 and Card 1/2

Experimental investigation ...

35. The stability in these shells is destroyed by the development of a continuous ring-shaped bulge. A theoretical study of the results shows that the effect of the geometric nonlinearity, which is of prime importance in the elastic stability of shells, gradually becomes smoothed out of range shell deformation. As plastic deformations in the plastic region develop, asymmetric bulgings become axisymmetrical. The stability of thick shells is calculated by a small-scale examination of the bulging. There are 3 figures and 5 references: 4 Soviet and 1 non-Soviet. The reference to the English-language publication reads as follows: G. Gerard, J. Aeronaut. Sci., 24, no. 4 (1957).

TITLE: Experimental investigation of buckling of cylindrical shells under axial compression combined with internal pressure

SOURCE: Prikladnaya mekhanika, v. 1, no. 10, 1965, 38-45.

TOPIC TAGS: cylindrical shell structure, shell buckling, internal stress, aluminum alloy, elastic stress, plasticity, buckling, pipe

ABSTRACT: The results of an experimental investigation of the buckling behavior of round duralumin tubes in both elastic and plastic regions under axial compression combined with internal pressure are presented. The effect of the magnitude of the pressure on the value of critical (buckling) compression stress and the influence of the path of loading are studied. A critical evaluation of available theoretical solutions is also presented. The testing of aluminum-alloy specimens (180 mm in diameter, 180 mm long, 0.5 mm wall thickness) by using various paths of loading (the sequence in applying the compressive force and internal pressure) in elastic and plastic regions is described in detail. In tests beyond the elastic limit, the effect of the loading path in the prebuckling state on the magnitude of the buckling load was estimated. The obtained experimental data are given in a table and are

Card 1/2

ACC NR: AP6000240

3

compared in diagrams with theoretical values of the buckling stresses calculated by using the solutions by B. O. Almroth and D. O. Brush (for the elastic region) and by E. I. Grigolyuk (for the plastic region). The experimental data make clear the very weak effect of the path of loading on the magnitude of the buckling load. The experimental values of the buckling stress are lower than the analytical ones in both elastic and plastic regions. It was ascertained that at the beginning, the buckling stress grows with increasing internal pressure, and reaches its maximum (in the elastic region), then gradually drops to zero (in the plastic region). The experiments demonstrated the inadequacy of theoretical solutions, especially in the transient region. Orig. art. has: 7 figures, 1 formula, and 1 table. [VK]

TITLE: Contactless fast-acting return current relay. Class 21, No. 188559

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 22, 1966, 58

TOPIC TAGS: electric relay, electronic circuit, transistorized circuit, electronic transformer

ABSTRACT: An Author Certificate has been issued for a contactless fast-acting return-current relay. The relay is used in automatic d-c disconnectors and contains a differentiating current transformer that initiates a pulse proportional to the rate of change of the current and a reacting unit. To use the relay in d-c return current circuits, a semiconductor AND circuit, connected between the differentiating transformer and the output unit, compares polarities of the above pulse and the line voltage. Orig. art. has: 1 figure.

TITLE: Investigation of the Combustion Process in Chambers of the Pulsating Type (Issledovaniye protsessa sgoraniya v kamere periodicheskogo tipa)

PERIODICAL: V sb.: Nekotoryye zadachi gidrogazodinamiki (MVTU, 67), Moscow, Oborongiz, 1955, pp 77-114

ABSTRACT: Describes the results of an investigation into the influence of the composition of the mixture and the cycle frequency on the combustion process of the fuel in a chamber with separate introduction of the components. Two independent investigative methods are applied:
1) The determination of the chamber pressure by means of a piezo-electric indicator equipped with a cathode-ray tube;
2) The stroboscopic withdrawal of gases and the subsequent analysis of their composition on a TN tester.

It is established that an increase in the excess coefficient from 1.18 to 1.45 results in a slow-down of the combustion of the fuel, whereas an increase in the cycle frequency from 410 to 660 cycles per minute

Card 1/2

124-11-12506

Investigation of the Combustion Process in Chambers of the Pulsating Type (cont.)

leads to an acceleration of the combustion. The combustion is most complete for an excess coefficient of 1.35 and least complete for 1.18.

Cattle Gadfly

"Application of a Solution of DDT in Oil Against
the Cutaneous Gadfly of Cattle in the Ukrainian
SSR," Vet. Physician G.K. Bozhko, Vet Admin, Min
Agri and Supply, Ukr SSR

Veterinariya, Vol 30, No 10, pp 62-63

A solution of DDT in solar oil has been successfully used since 1949 against the cutaneous cattle gadfly. The solution proved harmless to animals and especially effective in the treatment of the hide of animals during the early stages of formation of scirrhus. The gadfly of cattle is

268T47

common in all oblasts of the Ukr SSR. Examination of cattle for infestation with gadfly larvae must begin in Jan. in the northern oblasts of the Ukraine and towards the end of Dec in the southern oblasts.

USSR/Medicine - Veterinary, Diagnosis for Brucellosis

Card 1/1

Author : Bozhko, G. K., Veterinary Physician
Title : Methods for the diagnosis of brucellosis in cattle
Periodical : Veterinariya, 31, 35-36, May 1954
Abstract : The Main Administration of Animal Husbandry of the Ministry of Agriculture of the Ukrainian SSR has directed all veterinary agencies to use brucellosis allergen for eye test in combination with serological methods for the diagnosis of brucellosis in cattle. Use of allergen for eye test offers possibility for detecting latent cases of brucellosis in cattle and to verify clinical ones. Agglutination method is a specific method for the diagnosis of brucellosis in all types of animals. Although complement-fixation method has given excellent results in many cases where agglutination method failed, its use is limited by the fact that it is too complicated.

TITLE: The Study of the Repsold Meridional Circle in Nikolayev^{ne}

PERIODICAL: Izv. Gl. astron. observ. v Pulkove, 1958, Vol 21, Nr 2, pp 170 - 202
(Engl. résumé)

ABSTRACT: The instrument was studied in connection with its installation in Nikolayev^o (before the War it was in Pulkovo). The microscope-micrometers. The study of the periodic errors by Ridberg's method at temperatures ranging from $+17^{\circ}.1$ to $+20^{\circ}.0$ has shown that they are not great and can be disregarded. The eye-piece micrometer. The studied errors of the lead screw in right ascension are easily represented by a parabola. The errors of the lead screw in declination can be represented by three straight lines with discontinuity between them. The periodic errors of both screws were found to be negligibly small. Errors of the circle. The bending of the circle is eliminated if the angle is measured at two points in the circle which differ by 180° . The temperature gradients have an effect on the reading of the

Card 1/3

The Study of the Repsold Meridional Circle in Nikolayev

69854
SOV/35-59-9-6988

circle in a complex way, and in order to reduce the errors arising from this, it is desirable to carry out the measurements in direct and reverse directions. As a result of the deviation of the circle from the plane, perpendicular to the rotation axis, three types of errors arise in the readings of the circle: because of the non-perpendicularity of the circle and the rotation axis, because of the change in distance of the microscopes from the limb during its rotation, owing to the inclination of the microscopes. A special method was developed in order to allow for the latter error, amounting to $0''.06$ for the circle in question. The study of the degree graduation in circle "B" was carried out according to the rosette method, during the winter of 1955 - 1956. The corrections of the mean reading of the circle from 4 microscopes were obtained, with the mean error being $\pm 0''.05$. Comparison with a more detailed study of this circle carried out by Yelistratov, at $10'$ intervals, in 1940, (see RZhAstr. 1953, Nr 2, 649) showed that between the two results there is a systematic difference. Apparently, during the time the instrument was stored in the war years, the system of its graduation changed. The study of the bending was carried out by Bessel's method - through observations with the aid of horizontal collimators. Alltogether, during October 1956 - July 1957, 138 determinations of the

Card 2/3

The Study of the Repsold Meridional Circle in Nikolayev

⁶⁹⁸⁵⁴
SOV/35-59-9-6988

bendings were carried out, with the mean error for one determination being $\pm 0''.13$. In order to eliminate the personal error (amounting up to $0''.5$) a reversible prism was used. Examination has shown that the bending is temperature dependent and is, moreover, subject to irregular variations. Bibl. 21 titles.
